### **Emergency Notification System**

Server-Based Emergency Notification

Team Members

# Background

Customer needs and demands:

Effective mass notification

oReasonably low costs

•Ease of implementation

## Survey Results

In a recent poll we conducted on random individuals in the Engineering building,

- •60% Have not signed up for HU Alert
- •40% Have signed up for HU Alert

Average hours per week spent in labs: 20.8 hrs

Reasons for not signing up:

- Charges to phone bill
- •Never heard of it
- •Don't like filling out forms
- •Don't think they need it

#### **Problem Formulation**

**Problem Definition**: There is a need for more effective ways to inform students in Howard's Engineering Building of emergency situations on campus.

**Overall Design Functional Requirement**: Develop a server based notification system for Howard university Engineering building.

#### **Constraints**

- System should enforce user interaction.
- Inform within 8-12 minutes of incident report.
- Use effective and reliable communication media
- Must notify individuals at client computer stations.

### Design Requirement

#### **OPERATION, COST AND MAINTENANCE**

- System operation must require minimum technical know-how
- Estimated cost values are less than fifty dollars. This includes minute costs for on-network screen messages.
- Students do not have to sign up to get notifications
- o System should initiate through the base station.
- Screen pop-up should run until terminated by user confirmation.

### Design Constraint

#### REGULATIONS

- United Facilities Criteria for mass Notification Systems (4-021-01)
- Occupational Health and Safety Administration regulation(1910.165) for employers that use an alarm system
- o IEEE Standard for Software Test Documentation (std. 829)
- o IEEE Standard for Software Unit Testing (std. 1008)
- IEEE Standard Classification for Software Anomalies (std. 1044)
- o IEEE Standard for Software Safety Plans (std.1228)

### Solutions

Wired Audio System

o Visual Display

On-network messages (server based notification system)

### **Top Design Selection Process**

#### Decision Matrix

|                        | Visual Display<br>(Weight) | Audio System<br>(Wireless) | On-<br>Network<br>Screen<br>(weight) | Audio<br>Systems<br>(Weight) | Scale |
|------------------------|----------------------------|----------------------------|--------------------------------------|------------------------------|-------|
| Cost                   | 4 (40)                     | 7(70)                      | 10 (100)                             | 3 (30)                       | 10    |
| Reliable               | 7 (170)                    | 8(200)                     | 9 (225)                              | 7 (175)                      | 25    |
| Ease of Implementation | 5 (150)                    | 7(210)                     | 8 (240)                              | 3 (90)                       | 30    |
| # people<br>notified   | 5 (100)                    | 8(160)                     | 5 (100)                              | 8 (160)                      | 20    |
| Ease of use            | 6 (90)                     | 7(105)                     | 9(135)                               | 8(130)                       | 15    |
| Total                  | 550                        | 745                        | 800                                  | 585                          | 100   |

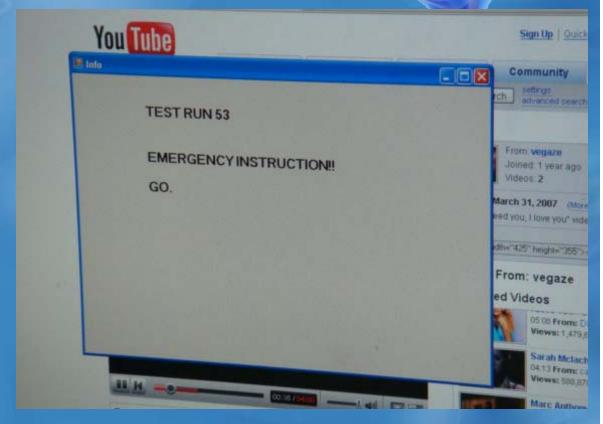

We changed the weights of our criteria to reflect the design requirements for our problem statement.

## Top design

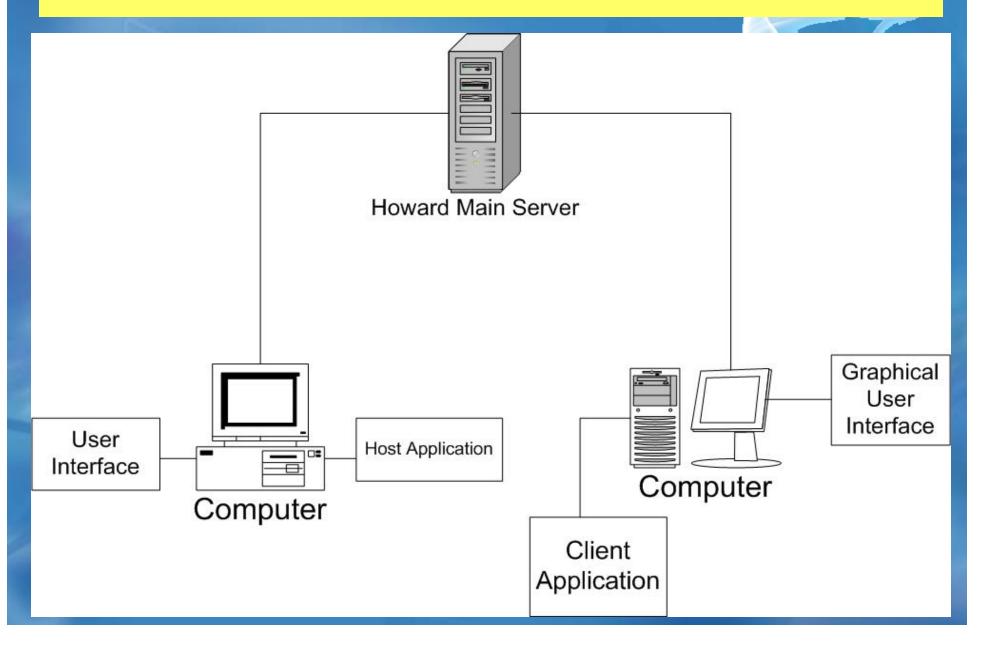

On-network messaging (server based notification system)

#### Advantages:

- 1. Innovative design.
- 2. Inexpensive.
- 3. Easy to use.
- 4. Interactive.

# **System Overview**

## **Implementation**

#### Breakdown of Tasks

- o Build a Remote Server
- Build a Host Application
- Build a Client application
- User Interface (Client end)
- User Interface (Server end)

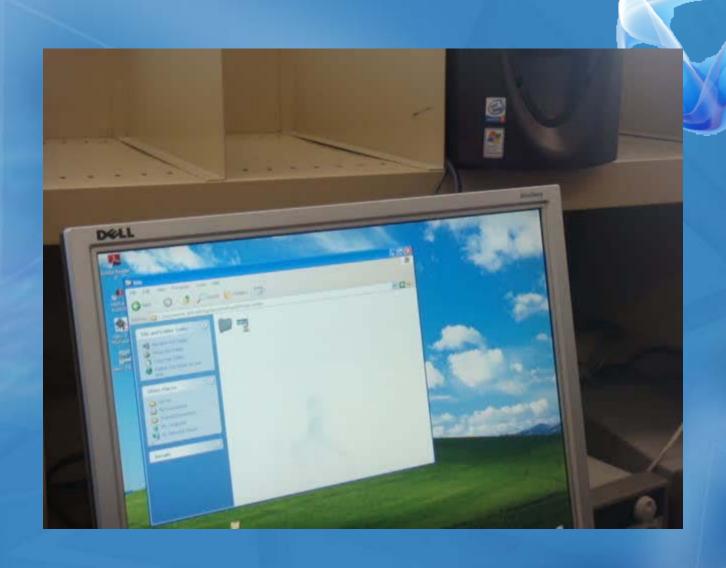

### Issues and Concerns raised

 Firewalls within different networks in the engineering building

 Insufficient knowledge of programming language prior to start of project

Administrative access to computers

# **Testing**

#### Performance Criteria

oAll clients logged in should receive message

•Message should always initiate from background

•Message should transmit within 3-5 seconds

Successful program should run 90% of the time

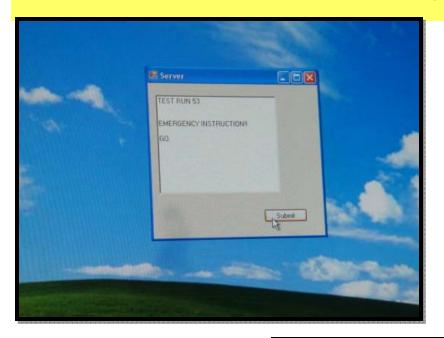

# Testing results (50 trials):

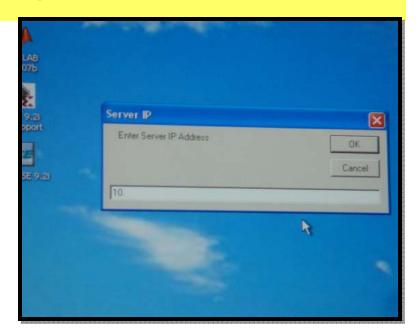

- 46 successful emergency transmissions
- 4 blocked due to lack of admin privileges
- o 92% successfully transmitted

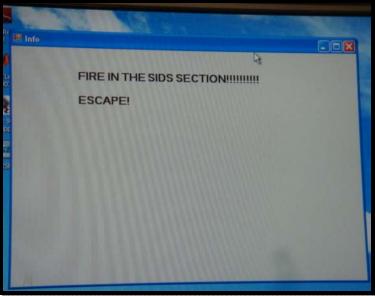

#### Per completed message:

- o 100% logged in Clients received message
- o 100% initiated from background
- o 100% transmitted within 3-5 seconds

#### **Testing Stages**

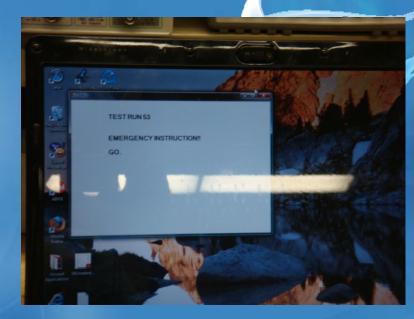

# **Testing - Continued**

## Timeline

### Lessons Learned

o Team work

 Importance of communication and camaraderie among team members

Importance and use of deadlines

o C# and .NET

#### **CONCLUSION**

- Dire need for an effective notification system among College and University campuses.
- Future Possibilities for Emergency Notification Systems.
- Design lifecycle: September2007 April 2008

We say a big thank you to the mentioned parties:

- EE Faculty
- Colleagues
