

The Bludger

A Drone Proposal

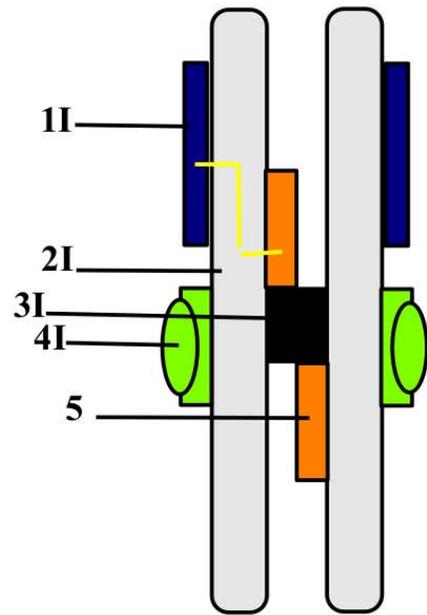

CONFIDENTIAL

**Please keep the contents
of this
presentation/project
confidential until further
notice**

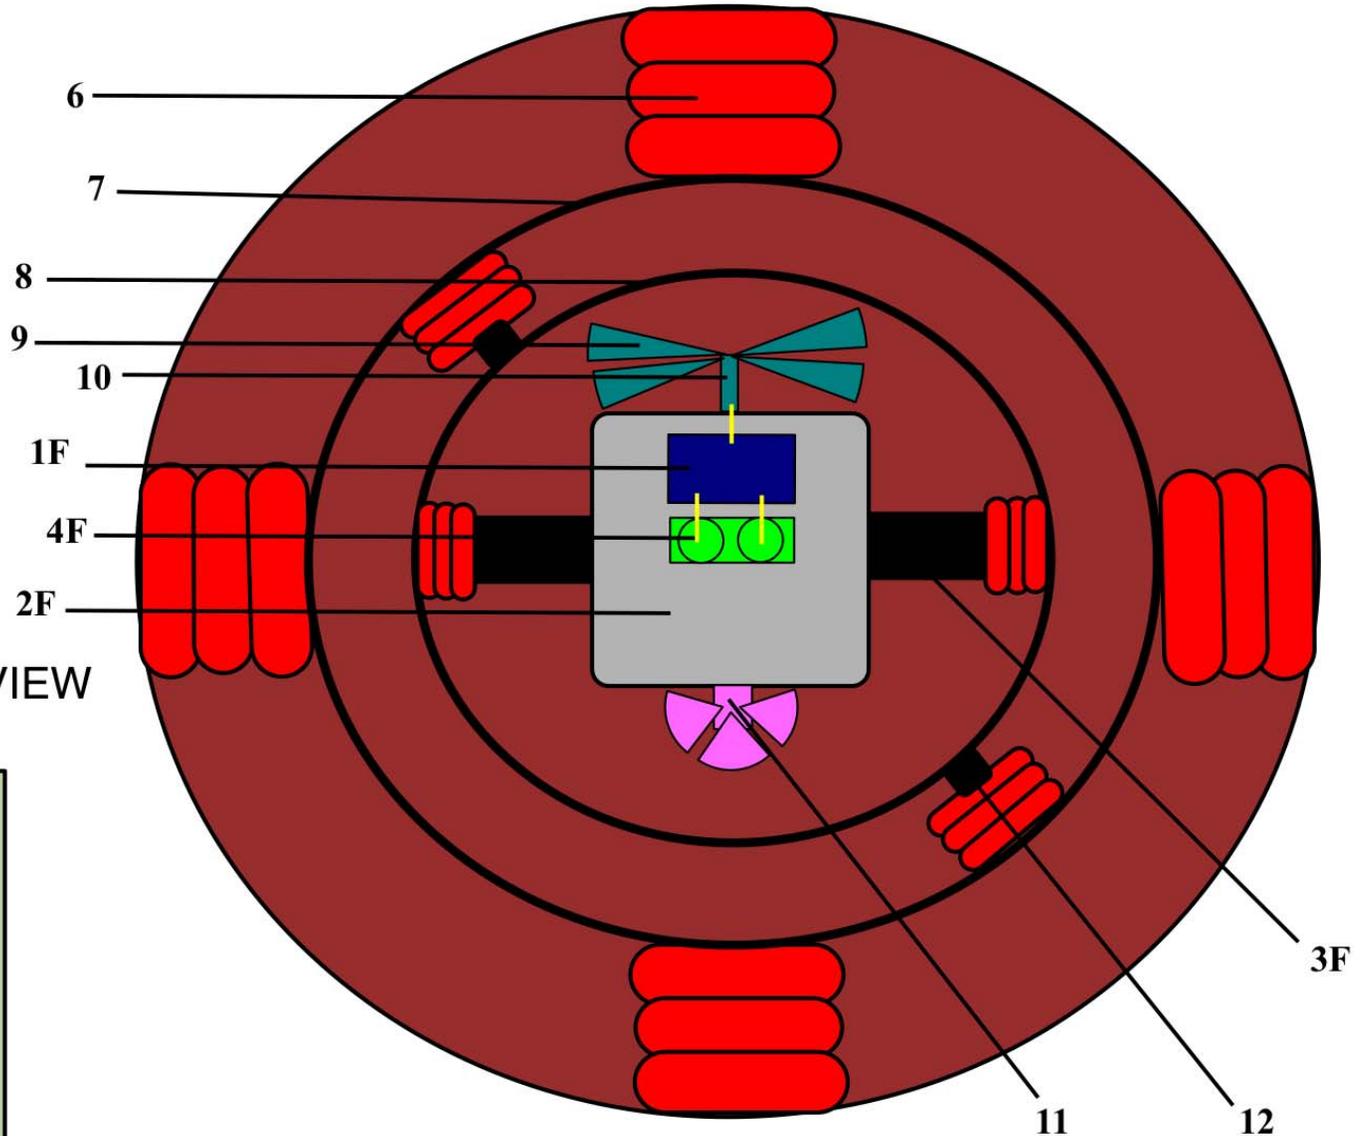

Using drone technology my goal for this project is to combine robotics and the Wizarding World of Harry Potter to bring to life one of the most memorable aspects of the series: the bludger

Exterior Body

In order to create the external spherical shape of the Bludger, I would need a team to build the external body as though they were constructing a spherical drone as indicated below

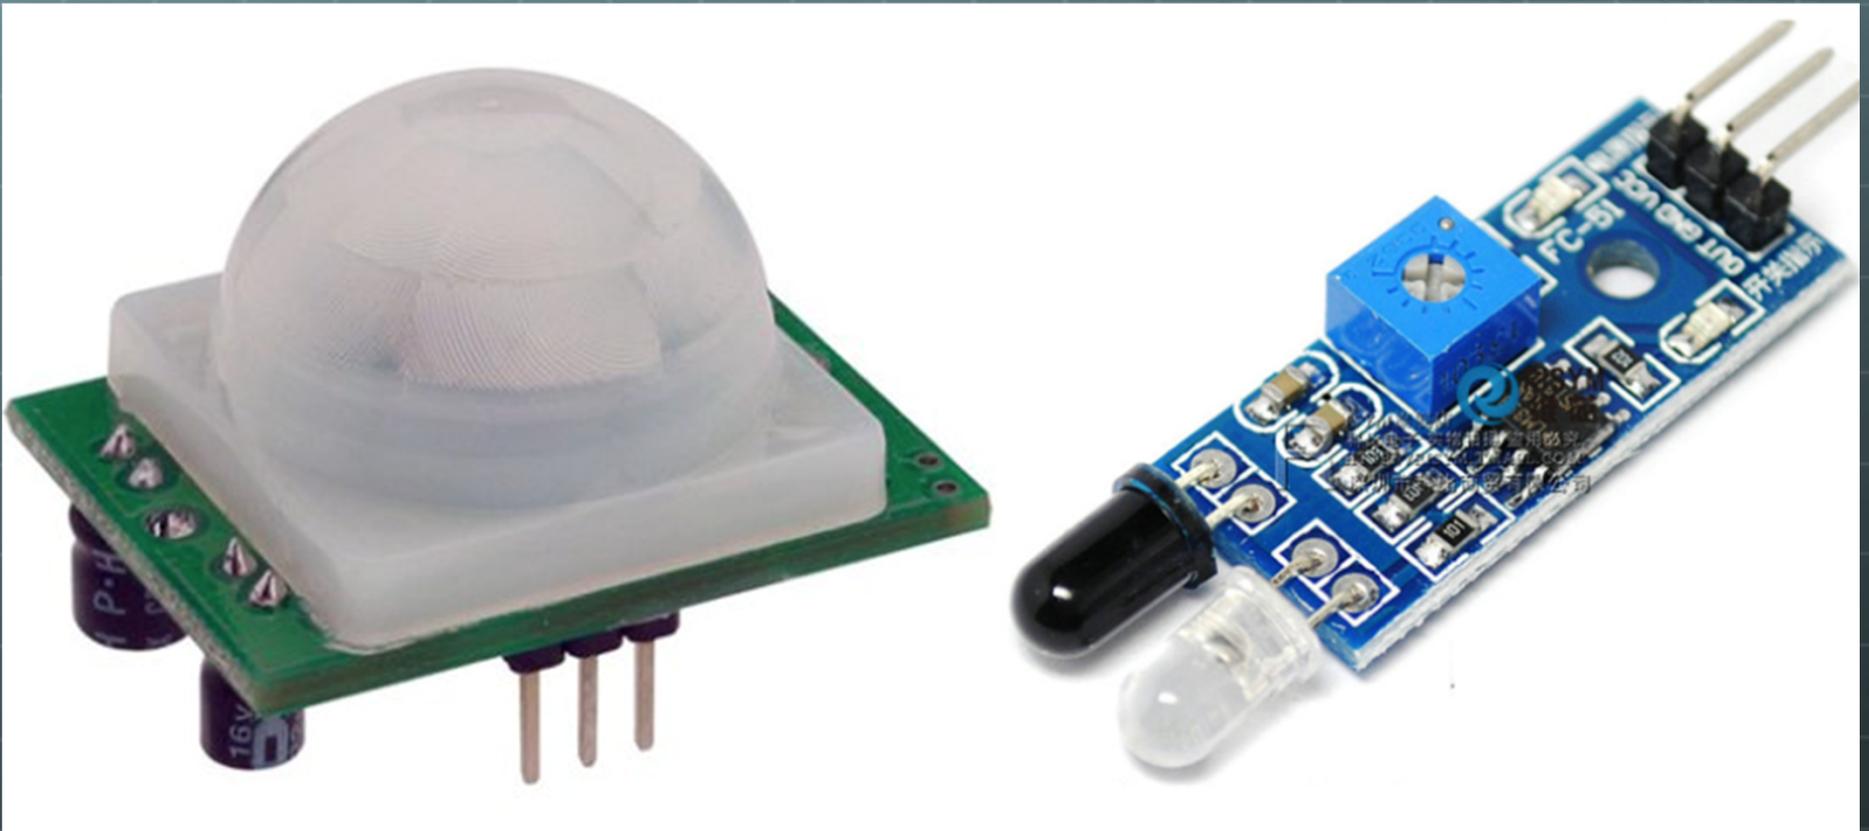

Interior Functions

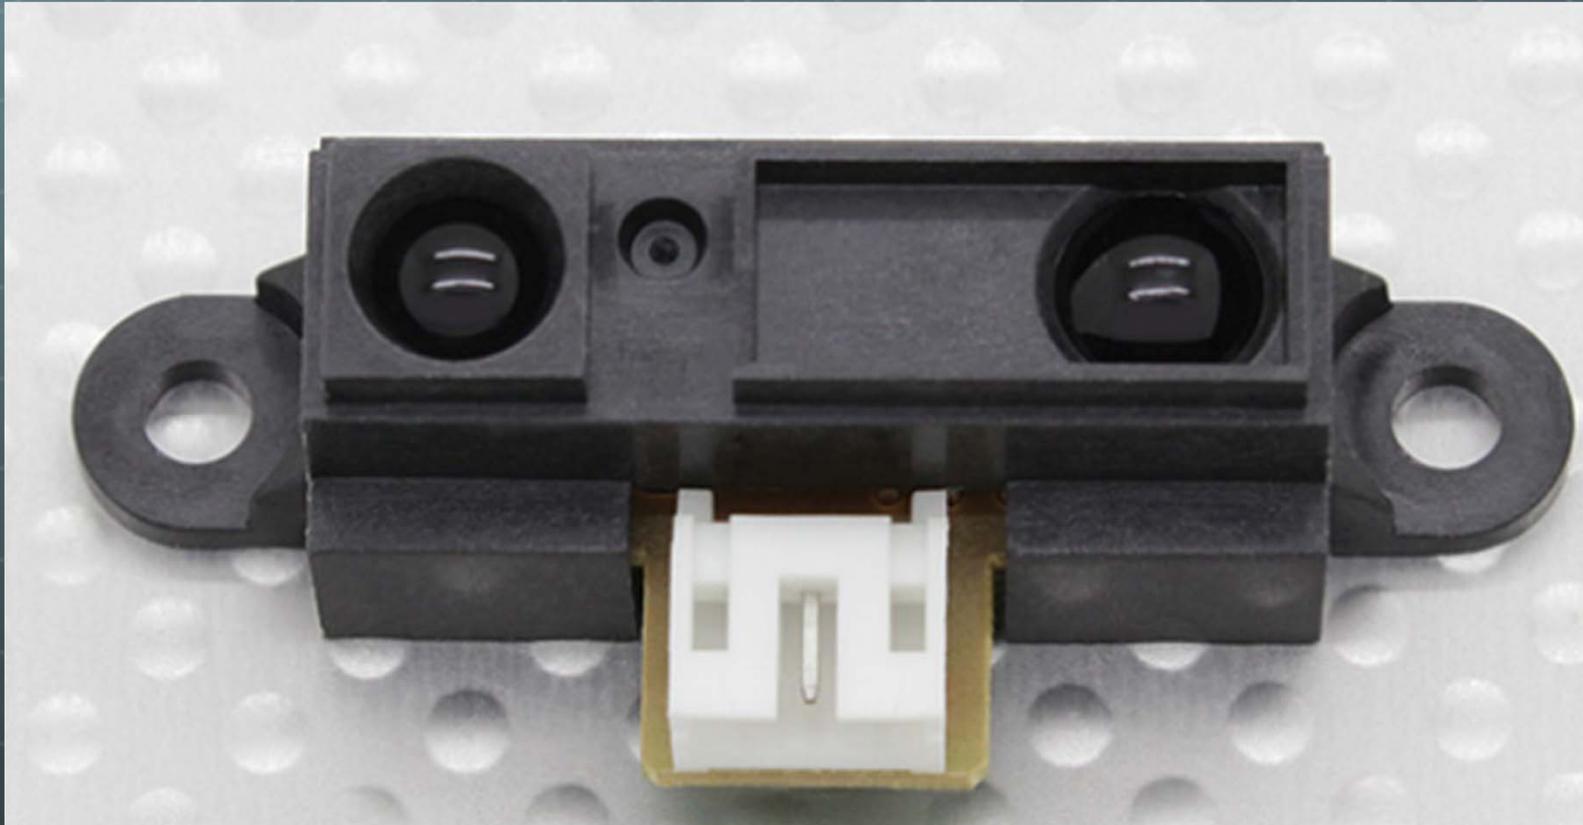

For the software component of the Bludger, I believe that Arduino boards can be programmed to facilitate the basic functions of the Bludger such as turning it on and off as well as controlling various sensor functions

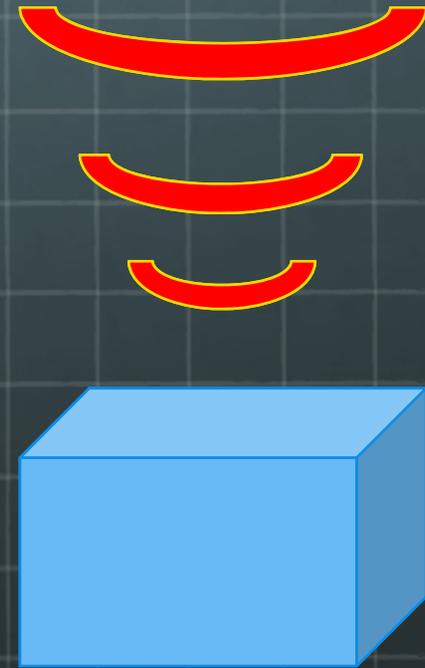

In order to infuse the Bludger with the “seeking” abilities seen in the movies, infrared motion sensors and obstacle detectors can be attached to the inner core of the spherical body

In order to prevent the Bludger from smacking into the ground, flying too high into the air, or going outside the parameters of the “quidditch field,” distance sensors can be programmed to assist the Bludger in changing direction as needed

The goal is to have the Bludger perform its functions in a mostly autonomous manner. The only non-autonomous aspect of the Bludger will be a return function, located on a base, that can be switched on at the will of the operator.
